

Weekly Report

26/12/2018 – 2/01/2019

Update about CCTV-UK Brexit project; There is some change in the project, but it is a small change that can handle. However, the bottleneck in the data collection part seems a problem for the next phase of visualization part, and I will press them to pass the data or mockup data to visualization part this week. One more thing, last week I take in charge to help the data collection part to read the English news articles for preparing the train data for the news text mining that extract features of pro-Leave and pro-Remain media; use SVM classifier to classify news.

About the visualization part, Linhao done the visualization of hashtag about Brexit and waiting for the news script from Ms. Wang and then edit it again. Also, waiting for another the data about the hashtag.

Siyi is implementing the visualization of the relation between the economy and immigration topic. Moreover, she will implement the stack bar chart to represent the percentage of the in and out groups reaction with the topics about Brexit base on media coverage.

Xinyi did the designing the two visualizations that Siyi are implementing and this week I will give her two new visualizations to her to start design and implement. These are the data about YouGov poll (the headline voting intention of people about the Brexit) and the news articles that I mention above.
